Wild Sheep and Disease

Across most of their historic range in western North America, bighorn sheep (*Ovis canadensis*), declined significantly between the mid-1800s and the mid-1900s. The causes of the decline included over harvesting as well as habitat alienation and health issues. Recovery efforts resulted in population increases in many areas, but not to historic levels. Bighorn sheep in B.C. remain on the BC Conservation Data Centre's provincial blue-list (i.e., the list of ecological communities, and indigenous species and subspecies of special concern in B.C.), partly because of their vulnerability to disease.

Wild sheep in general, both bighorn sheep and thimhorn sheep (*Ovis dalli*), are susceptible to a variety of infectious organisms, in particular those that cause respiratory diseases or pneumonia. Respiratory disease in wild sheep can occur “naturally” and includes infection by their own species of lungworms as well as bacteria. However, the syndrome of severe, life threatening pneumonia is associated with bacteria that include specific strains of *Pasteurella multocida*, *Mannheimia haemolytica* and *Mycoplasma ovipneumoniae*. These bacteria are carried by domestic sheep/goats where they may or may not cause disease due to adaptations from thousands of years of domestication. When wild sheep are exposed to such organisms they do not develop effective immune responses and pneumonia outbreaks can result in die-offs, affecting 5-95% of the herd. The disease may persist in survivors, resulting in years of low lamb survival and population declines. Research efforts have confirmed to North American wild sheep managers that physical separation of wild and domestic sheep/goats is the only management tool currently available to reduce the risk of disease transmission.

To assist in maintaining this separation, producers of domestic sheep and goats on private land in areas shared by wild sheep are encouraged to better understand this issue and to work with wildlife managers (see www.wafwa.org/Documents%20and%20Settings/37/Site%20Documents/Working%20Groups/Wild%20Sheep/Publications/Rec_For_DS_and_GT_Management_in_WS_Habitat.pdf). Options recommended in the publication include switching species to other domestic livestock, using fencing practices that prevent nose-to-nose contact between wild sheep and domestic sheep and goats, employing effective livestock guardian dogs and controlling movements of domestic sheep and goats in areas where they may attract, or be attracted to, wild sheep.

If you observe wild sheep displaying potential signs of poor health (i.e., excessive coughing, running noses, diarrhea, lethargy), or wild sheep that are in the same pasture as domestic sheep and goats, please report it to the RAPP line at 1-877-952-7277, or the local FLNRORD Regional Office.

For more information on wild sheep and diseases, please see the documents and webpages developed by the Western Association of Fish and Wildlife Agencies (www.wafwa.org), the Wild Sheep Foundation (www.wildsheepfoundation.org) and the Wild Sheep Society of BC (www.wildsheepsociety.com). Further, see the Wild Sheep Society of BC's article in this synopsis on the collaborative BC Sheep Separation Program.
